

BRIEF OVERVIEW – GEMINI

The Photonic Toroidal Vortex (PTV) program is a research initiative that seeks to derive atomic phenomena from a purely geometric, phenomenological model based on helical strings and toroidal vortices. The model achieves high consistency by grounding all physical phenomena in the self-regulating geometry of the toroidal vortex. By postulating that $Sp-1$ and $Sp-2$ rotations must maintain an action of h , the program provides a deterministic, causal framework for atomic states.
